

Maize herbicides: Solar Plus

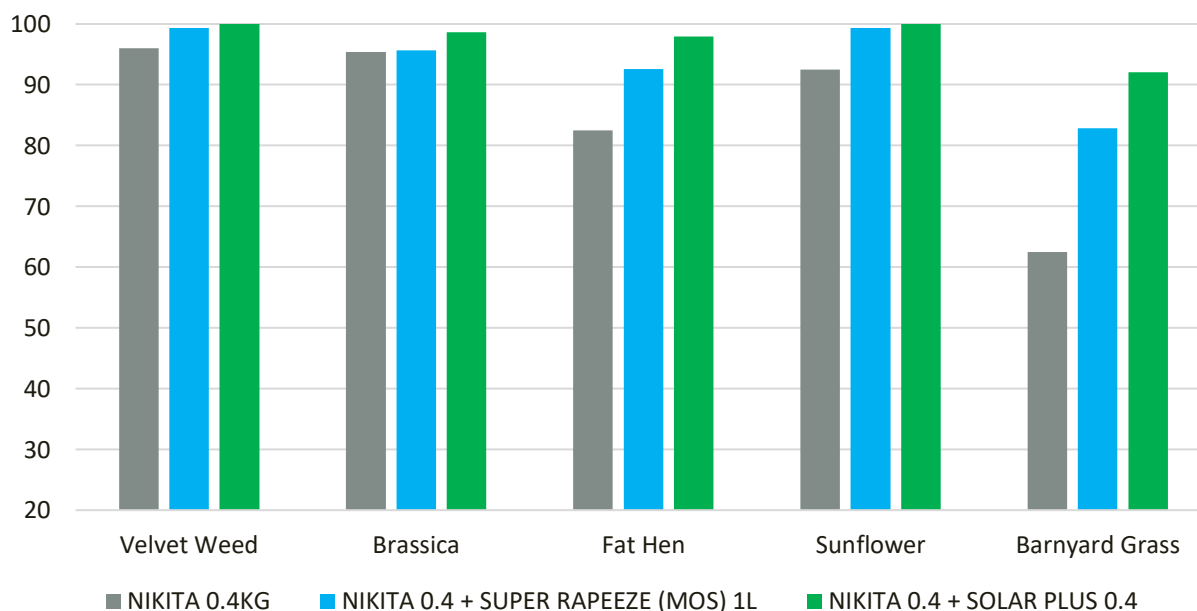

- **Water conditioning important for herbicides affected by hard water such as sulfonylureas.**
- **Improved coverage of herbicides over weeds.**
- **Increased kill of difficult weeds such as Barnyard Grass.**

Including Solar Plus at a minimum of 0.2% of water volume (0.4L/ha in 200L/ha water volume) with post emergence herbicides will improve the coverage of spray solutions over target weeds. Solar Plus will also improve penetration of herbicides through the waxy cuticle into the target weed.

Many of the post emergence herbicides used in maize are sulfonylureas which are affected by hard water. Solar Plus has a built-in water conditioner that will protect herbicides from the negative effects of hard water.

Solar Plus is very effective at improving the control of certain weeds such as Barnyard Grass and Fat Hen. Both Barnyard Grass and Fat Hen can be very competitive and cause huge loss of vigor in young maize crops and therefore the end yield.

Nikita = Nicosulfuron, Mesotrione, Dicamba

Add Solar Plus to the tank first. Max inclusion of Solar Plus 0.5%. Full rate plant protection products can be used with Solar Plus up to and including tip of tassel visible.
